4 star based on 50 reviewsEXCLUSIVE: With the July 31 July 4 weekend in full swing, Warner Bros. is launching a \$175 million wide theatrical push for their movie The Dark Knight Rises, and the studio is now looking to officially start lifting the lid on the third installment of Christopher Nolan's Batman series in August. The studio has hired Leggett & Platt to set up the marketing for the film, which co-stars Christian Bale as the Caped Crusader, who has to go head to head with The Joker, the title character from the DC Comics series created by Bob Kane and Bill Finger. "The Dark Knight Rises is an epic action adventure that is among the most anticipated and exciting films of the summer," says Chris Ferguson, Warner

Bros. president of worldwide marketing and distribution. "We are thrilled to have the finest talent in the industry working on this film."

Produced by Christopher Nolan and his wife, screenwriter Emma Thomas and their longtime producing partner. David S. Goyer, and Nolan regular collaboration partner Ian Nolan, this is Nolan's second outing with Bale, who played Batman in the 2006 adaptation of Frank Miller's *The Dark Knight Returns*. Nolan has now directed all three of his studio-backed Batman films. Nolan's next movie will be the sci-fi *Interstellar*, which is currently in production and will be released in November, as he serves as producer. The director is executive producing the seventh season of HBO's Emmy-winning drama *The Sopranos*, which is currently playing its final episodes.

Characterization of an aberrant 14q allele in a patient with oral cavity squamous cell carcinoma. Aberrant chromosomes involving chromosome 14 are found in various malignant neoplasms. Although it is believed that the common occurrence of these aberrations in different histological types of tumors is the result of a common predisposing genetic condition, there have been no reports of chromosome 14 aberration in oral cavity squamous cell

carcinomas (OSCCs). In the present study, we describe the characterization of an aberrantly 14q11-q21 chromosomal derivative in a patient with OSCC. The patient was a 53-year-old man with left gingival SCC. The tumor cells showed an inversion of the short arm of chromosome 14. Using fluorescence in situ hybridization (FISH) with two locus-specific probes
